 ${\bf Pred.}$ No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumnour in an individual having low tumnour burden. The antibody 11010 is used to prevent the recurrence of HMFG-associated tumnours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for treating breast tumnours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                This cDNA sequence encodes the heavy chain variable region VH (AAM85150) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line ATCC 12020. 11D10 was obtained by immunising naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFG). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG-associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are and/or 11D10 polypeptides and/or 11D10 polypurcleotides, including methods of treating HMFG-associated thousand are and/or 11D10 polypurcleotides, including methods of treating HMFG-associated.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80
                                                                                                                                                                                                                                                                                      The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for TEA (e.g. 3H1). The method is useful for anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for present DNA sequence encodes the heavy chain variable region of the mouss 11D10 anti-idiotype antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20

Monoclonal antibody 6A4 reacts with the OMP-1 protein of all 19 known serotypes of P.aeruginosa. It is used for therapy and diagnosis of infection, and as a carrier for drugs. The antibody is IgG2a subclass. (Updated on 31-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAQ79929 and AAQ79930 encode AAR66757 and AAR66758, the light chains of an animal derived anti-tobacco mosacic virus (TMV) monoclonal antibody. The cDNAs were incorporated into a Ti plasmid vector, which was incorporated into A. tumefaciens. The resultant plant expression vector was used to transform tobacco plants, making them TMV resistant, the plants could also be biofarmed for the prodn. of anti-virus antibodies.
                                                                               Anti-tobacco mosaic virus monoclonal Ab heavy chain cDNA.

The invention relates to a chimaeric molecule comprising the GD3 (ganglioside antigen) binding domain of antibody MB3.6, with any of 3 variable gene sequences, or the PSMA (prostate-specific membrane antigen) binding domain of antibody 3D8, 4D4 and 3B11, with variable gene sequences, the zeta signalling chain of the T cell receptor and an intervening CD812pha hinge in which cysteine residues have been mutated. The chimaeric molecules expressed in T cells or NK cells or other effector cells are useful in treating patients with cancers expressing the GD3 (MB3.6 derivatives) or PSMA antigen (3D8, 4D4, 3B11 constructs to engage additional stimulatory and functional properties of the effector cells to enhance the antitumour therapeutic efficacy (claimed). They are particularly useful in disorders including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CysLysAlaSerGlyTyrThrLeuThrSerTyrAsnMetHisTrpValLysGlnThrPro 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The OK3T heavy chain sequence was isolated from a cDNA library prepared from OK3T producing cells. The library was screened with a probe complementary to a sequence in the mouse IgG2a constant CH1 domain region. The OK3T sequence was used in CDR-grafting experiments to prepare humanised antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21 AlaTyrLeuGlnGlnSerGlyAlaGluLeuValArgSerGlyAlaSerValLysMetSer

disorders (haemophilia, thrombosis), inflammatory disorders (Crohn's disease), tumours, bacterial, fungal or viral infections, depression and psoriasis. AAA45926 to AAA45931 represent linker variants which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                            (multiple sciences, insulin dependent diabetes), allergic conditions (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation
                                                                                         chemokinetic; analgesic; haemostatic; thrombolytic; antilifiammatory; cytostatic; antibacterial; antifungal; antiviral; antidiabetic; antibathmatic; vulnerary; antiulcer; osteopathic; neuroprotective; nootropic; antiparkinsonian; antipsoriatic; cerebroprotective; anticonvulsant; and antidepressant. The SESTs can be used for gene therapy and in vaccines. The SESTs are useful as probes for the identification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising antibolies. They may be useful for treatment of autoimmune disorders
tissue sources. The SESTs can have a range of activities depending the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a transgenic, non-human animal with its genome altered to constitutively express a molecule having a constant region which can bind an IgE receptor on mast cells in the animals, the molecule having an immunoglobulin structure and being further capable of specifically binding a predetermined antigen. The transgenic animal is useful as a model for evaluating the activity and the ability of substances i.e. with antiallergic activity, to affect any allergic reaction caused in the animal by the administration of the antigen to the animal, and applying the substance to be evaluated. The present sequence encodes the mouse immunoglobulin E (IGE) heavy chain, given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GlyGlnGlyLeuGluTrpIleGlyAsnIlePheProGlyAsnGlyAspThrTyrTyrAsn

The antibodies are useful in passive immunisation avoiding negative immune reactions. They are also useful in assaying and in vitro imaging (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polynucleotide(s) encoding Immunoglobulin molecules - used for efficient prodn. of chimeric human or non-human or class switched antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                           80
                                                                                                                                                                                                                                                                                                                                                                                         66
                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                            The present sequence encodes the mouse antibody 2H7 heavy chain variable region. Antibody 2H7 is specific for human B-cell antigen. The antibody sequence was used to construct a chimeric human-mouse antibody. In the course of the invention. The chimeric antibody is expressed in a secretion vector comprising a pelB pectate lyase secretion signal peptide. The pelB pectate lyase secretion sequence is useful for producing a protein such as a chimeric antibody in a bacterial host. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MetGluCysSerTrpValPheLeuPheLeuLeuSerIleThrThrGlyValHisSerGln

The present invention describes a method for preparing an immunoglobulin that is capable of binding antigen involves modular assembly of that is capable of binding antigen involves modular assembly of cantibodies through gene cloning and expression of light and heavy chains. The cloned immunoglobulin gene can be produced by expression in genetically engineered organisms. The method comprises: (a) expression in genetically engineered organisms. The method comprises: (a) expression, consider that cloned involves the second nucleic acid that encodes a bacterial signal sequence operably linked to either the light chain or light chain confirmation of fragment, and obtaining the immunoglobulin from the periplasmic space or culture medium; or (b) operably linking a nucleic acid encoding a bacterial signal sequence to a nucleic acid encoding the heavy chain or the light chain variable region or the light chain variable region or the heavy chain or the light chain variable region or both of the cransport of the heavy chain or heavy chain fragment, or the variable regions through the cytoplasmic or light chain fragment, or the variable regions through the cytoplasmic contains or heavy chain fragment, and a light chain or heavy chain fragment, and the light chain fragment or heavy chain fragment, and a light chain or heavy chain fragment or heavy chain fragment and a light chain or heavy chain fragment.

The method is useful for producing genetically engineered antibodies of method is also useful large scale production of human antibodies.

Continue the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ---GlyAsnTrpGluGlyAlaLeuAspTyrTrpGlyGlnGlyThrSerValThrValSer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MetGluCysSerTrpValPheLeuPheLeuLeuSerIleThrThrGlyValHisSerGln
                                                                                                        Secretable immunoglobulin heavy and light chain fragments - capable of assembling into chimeric antibodies, useful for e.g. passive immunisation, diagnosis, etc
                                                                                                                                                                                                            A cDNA clone (AAT70868) codes for the heavy chain variable region (AAW16343) of the 2H7 mouse monoclonal antibody, which recognises human B-cell surface antigen Bp35. The sequence was isolated from a 2H7 cell line cDNA library by PCR amplification. The 2H7 light chain variable sequence (AAT60869) has also been isolated. The antibody with specificity for the human-mouse chimaeric updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlnIleSerSerLeuThrSerGluAspSerAlaValTyrPheCysAlaArg

The present sequence was used in the development of a novel method for the production of an immunoglobulin (1g) fragment capable of binding an antigen. The method comprises culturing an E. coli host that has been transformed with a nucleic acid molecule encoding the 1g fragment, under conditions so that the 1g fragment is produced and secreted. The nucleic acid molecule comprises DNA sequences and secreted. The nucleic acid molecule comprises DNA sequences and secretion signal sequence operably linked to a DNA sequence encoding at least the variable region of an 1g light chain, where (a) and (b) are operably linked to a DNA sequence encoding at least the variable region of an 1g light chain, where (a) and (b) are operably linked to a plant chain, where (a) and (b) are operably linked to a single prokaryotic promoter to form a dicistronic transcription unit. The method is used to produce chimeric Fab molecules, e.g. derived from murine monoclonal antibody 2H7 raised against human B-cell surface antigen. The invention provides a gainst human B-cell surface antigen. The invention provides a properties. The cloned Ig gene products can be produced by chemical gene synthesis, recombinant DNA cloning and production of chemical gene synthesis, recombinant DNA cloning an effective compliant of the efficient large scale producing a solution of human maniform when the efficient large scale producing a solution of human maniform when the efficient large scale producing a solution of properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention also provides a solution to

Production of chimeric antibody fragments - by culturing E. coli transformed with dicistronic expression cassette

Example IV; Fig 21; 98pp; English.

The present sequence was used in the development of a novel method for the production of an immunoglobulin (1g) fragment capable of binding an antigen. The method comprises culturing an E. coli host that has been transformed with a nucleic acid molecule encoding the that has been transformed with a nucleic acid molecule encoding the and secreted. The nucleic acid molecule encoding the sequences and secreted. The nucleic acid molecule comprises DNA sequences conditions so that the Ig fragment is produced and secreted. The nucleic acid molecule comprises DNA sequence encoding at least the variable region of an Ig Hight chain, where (a) and (b) are operably linked to a DNA sequence encoding at least the variable region of an Ig light chain, where (a) and (b) are operably linked to a bingle profaction promoter to form a dicistronic transcription unit. The method is used to produce chimeric Fab molecules, e.g. derived from murine monoclonal antibody 2H7 raised against human B-cell surface antigen. The invention provides a novel approach for producing genetically engineered antibody 2H7 raised castred variable region specificity and constant region production of chemical gene synthesis, recombinant DNA cloning and production of chemical gene synthesis, recombinant DNA cloning and production of specific Ig chains in various organisms provides a solution to the problem of class switching antibody molecules.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     816
